No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Sequence 12, Application US/10113996

Patent No. 6761889

GENERAL INFORMATION:
APPLICANT: Lowman, Henry B.
APPLICANT: Jardieu, Faula M.
APPLICANT: Lowe, John
TITLE OP INVENTION: Improved Anti-IgE Antibodies
FILE REFERRICE: P11230308

CURRENT FILING DATE: 2002-04-01

PRIOR PILING DATE: 1997-07-02

PRIOR APPLICATION NUMBER: US 08/887,352

PRIOR PLING DATE: 1997-07-02
                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence 11, Application US/10113996

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

GENERAL INFORMATION:

APPLICANT: RALL, HOWARD A.

TITLE OF INVENTION: COMBINATION OF DEHYDROEPIANDROSTERONE OR

TITLE OF INVENTION: ANTIBODY FOR TREATMENT OF ASTHWA OR CHRONIC OBSTRUCTIVE

TITLE OF INVENTION: AUTHONARY DISEASE

TITLE OF INVENTION: AUTHONARY DISEASE

TITLE REFERENCE: 30775-723.501

CURRENT APPLICATION NUMBER: US/10/923,327

Sequence 19, Application US/10923327

PUBLICARIN NO. US2005261208A1

SEQUENCE INFORMATION:

APPLICANT: ROBINSON, CYNTHIA B.

APPLICANT: BALL, HOWAND A.

TITLE OF INVENTION: COMBINATION OF DEHYDROEPIANDROSTERONE OR

TITLE OF INVENTION: DEHYDROEPIANDROSTERONE OR

TITLE OF INVENTION: ANTIBODY FOR TREATMENT OF ASTHWA OR CHRONIC OBSTRUCTIVE

TITLE OF INVENTION: PULLOON FOR TREATMENT OF ASTHWA OR CHRONIC OBSTRUCTIVE

TITLE OF INVENTION: PULLOON FOR TREATMENT OF ASTHWA OR CHRONIC OBSTRUCTIVE

TITLE OF INVENTION: PULLOON FOR TREATMENT OF ASTHWA OR CHRONIC OBSTRUCTIVE

Producing an antibody or antigen binding fragment in high yield in a cell culture, comprises expressing a variable domain with a modified framework region in a host cell.

Claim 13, SEQ ID NO 14; 161pp; English

The present invention describes a method for producing an antibody or antigen binding fragment in high yield in a cell culture. The method comprises expressing a variable domain of the antibody or antigen binding fragment comprising a modified framework region (FR) in a host cell, and recovering the antibody or antigen binding fragment variable domain comprising the modified framework from the host cell. The modified FR in the method described above has a substitution of at least one amino acid

```
with a corresponding HVR1 and/or HVR2 sequence of the variable domain.

The antibody or antigen binding fragment variable domain comprises the modified FR that has improved yield in cell culture compared to an unmodified antibody or antigen binding fragment. The antibody and antigen binding fragment. The antibody and antigen binding fragment The antibody herapy. The hinding fragment have cytostatic, antinflammatory, antianglogenic and immunomodulatory activities, and can be used in antibody therapy. The producing antibodies or antigen binding fragments in cell culture, in particular for improving the yield of recombinant antibodies or antigen binding fragment antibodies or antigen binding fragment antibodies or antigen bed to diagnose, treat, inhibit or prevent e.g. tumours and inflammatory, angiogenic and immunological disorders. The present caequence represents a heavy chain HVR1 peptide of an anti-VEGF (vascular endothelial cell growth factor) antibody, which is used in the exemplification of the present invention.
position with a different amino acid, where the different amino acid is the amino acid found at the corresponding FR position of a human subgroup variable domain consensus sequence that has a hypervariable region 1 (HVR1) and/or HVR2 amino acid sequence with the most sequence identity

The humanised antibodies are used to inhibit VEGF-induced angiogenesis, particularly for treating or preventing tumours (of any type) and retinal disorders (e.g. age-related macular degeneration or diabetic retinopathy). They can also be used to treat other conditions that involve angiogenesis, e.g. rheumatoid arthritis, psoriasis, atherosclerosis, Grave's disease, etc
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    factor - for treatment of tumours, retinal disease and other angiogenic states, also related nucleic acid, vectors and transformed cells.

The present invention relates to humanised anti-VEGF (vascular endothelial growth factor) antibodies or a variant of a parent anti-VEGF antibodies are useful for inhibiting VEGF-induced angiogenesis in a mammal (particularly a human), particularly those having a tumour or a retinal disorder e.g. intraocular neovascular disorders. The present sequence is an exemplary heavy chain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New humanized anti-VEGF (vascular endothelial growth factor) antibodies or their variants, useful for inhibiting VEGF-induced angiogenesis in a mammal, particularly for treating tumor or retinal disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                               Cytostatic; ophthalmological; humanised; antibody; anti-VEGF; VEGF; vascular endothelial growth factor; anglogeneals inhibitor; tumour; retinal disorder; intraocular neovascular disorder; Y0192; heavy chain; variable domain.
hybridoma cells and those with affinity for VEGF are identified by immunoprecipitation or by an in vitro binding assay

Humanised F(ab)-12 and affinity matured anti-VEGF antibodies may be used to treat conditions characterised by undesirable excessive necovascularisation. Such conditions include tumours (especially solid ones), rheumatoid arthritis, psoriasis, atheroscierosis, diabetes and cher retinopathies, retrolental fibroplasia, age-related macular degeneration, necvascular glaucoma, haemangiomas, thyroid hyperplasias and chronic inflammation. Oedemas associated with tumours, strokes and head trauma, and sacites associated with malignancies, meig's syndrome, humg inflammation, nephrotic syndrome, pericardial effusion and pleural effusion, may also be treated. Monoclonal antibodies are generated in

The present invention describes an antibody comprising a variant heavy chain hinge region incapable of inter-heavy chain disulfide linkage. Also described: (1) an antibody lacking inter-heavy chain disulfide linkage. Also (2) an immunoconjugate comprising the antibody conjugated with a cherologous moiety; (3) a composition comprising the antibody or immunoconjugate, and carrier; (4) an article of manufacture comprising the composition in a container; (5) a polymucleotide encoding the antibody or immunoconjugate, or a variant immunoglobulin heavy chain cantibody or immunoconjugate; (6) a polymucleotide encoding the comprising the recombinant vector; (8) expressing in a host cell comprising the recombinant at least one inter-heavy chain disulfide linkage; (6) a recombinant comprising the recombinant at least one inter-heavy chain disulfide linkage; (6) an approsylated antibody produced by the method; and (10) treating, clinkage is eliminated, and recovering the antibody from the host cell; (7) an aglycosylated antibody produced by the method; and (10) treating, preventing, diagnosing, delaying or preventing, diagnosing, delaying or preventing a disease in a subject. The antibody preventing, diagnosing, diagnosing, delaying or preventing a disease, e.g. tumour, cancer or immune disorder. The present sequence represents the anti-VEGF heavy chain from the expression cassette of the present function of the present function of the present function of the present function of the capacity or preventing the anti-VEGF heavy chain from the expression cassette of the present function of the capacity or preventing the function of the present function of the capacity or preventing the function of the expression cassette.
                                                                                                                                                                                  New antibody comprising a variant heavy chain hinge region incapable of inter-heavy chain disulfide linkage, useful for treating, preventing, diagnosing, delaying or preventing a disease, e.g. tumor, cancer or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Example 1; SEQ ID NO 12; 124pp; English.

```

The present invention describes a method for producing an antibody or antigen binding fragment in high yield in a cell culture. The method comprises expressing a variable domain of the antibody or antigen binding fragment comprising a modified framework region (FR) in a host cell, and recovering the antibody or antigen binding fragment variable domain comprising the modified framework from the host cell. The modified FR in the method described above has a substitution of at least one amino acid to position with a different amino acid, where the different amino acid is constituted found at the corresponding FR position of a human subgroup variable domain consensus sequence that has a hypervariable region 1 (HVR1) and/or HVR2 amino acid sequence with the most sequence identity variable domain comprises the modified FR that has improved Yield in cell culture compared to an modified antibody or antigen-binding fragment. The antibody and antigen binding fragment. The antibody and antigen commodified antibodies or antigen-binding fragment. The antibody and antigen methods and compositions of the present invention are useful for particular for improving the Yield of recombinant antibodies or antigen binding fragments in cell culture, in particular for improving the Yield of recombinant antibodies or antigen binding fragments of the invention can be ö Producing an antibody or antigen binding fragment in high yield in a cell culture, comprises expressing a variable domain with a modified framework region in a host cell. antibody; antigen binding fragment; cell culture; variable domain; modified framework region; hypervariable region; cytostatic; antiinflammatory; antiangiogenic; immunomdulatory; antibody therapy; tumour; inflammatory disorder; anglogenic disorder; immunological disorder; anti-VEGF antibody; anti-vascular endothelial cell growth factor antibody; heavy chain. The present invention describes a method for producing an antibody or antigen binding fragment in high yield in a cell culture. The method comprises expressing a variable domain of the antigen binding fragment comprises expressing a modified framework region (FR) in a host cell, and recovering the antibody or antigen binding fragment variable domain comprising the antibody or antigen binding fragment variable domain comprising the author described above has a substitution of at least one amino acid to position with a different amino acid, where the different amino acid is position with a different amino acid, where the different amino acid is constituted found at the corresponding FR position of a human subgroup variable domain consensus sequence that has a hypervariable region 1 (HYR1) and/or HYR2 amino acid sequence with the most sequence identity ith a corresponding HYR1 and/or HYR2 sequence of the variable domain.

The antibody or antigen binding fragment variable domain comprises the modified FR that has improved yield in cell culture compared to an entigen antibody or antigen-binding fragment. The antibody and antigen
                                                                                                                                                                                                      ö

ö
binding fragment have cytostatic, antiinflammatory, antiangiogenic and immunomodulatory activities, and can be used in antibody therapy. The methods and compositions of the present invention are useful for producing antibodise or antigen binding fragments in cell culture, in particular for improving the yield of recombinant antibodies or antigen binding fragments in cell culture. The antibodies of the invention can be used to diagnose, treat, inhibit or prevent e.g. tumours and inflammatory, angiogenic and immunological disorders. The present sequence represents the heavy chain of an anti-VEGF (vascular endothelial cell growth factor) antibody, which is used in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention describes a method for producing an antibody or antigen binding fragment in high yield in a cell culture. The method comprises expressing a variable domain of the antibody or antigen binding fragment comprising a modified framework region (FR) in a host cell, and recovering the antibody or antigen binding fragment variable domain comprising the modified framework from the host cell. The modified FR in the method described above has a substitution of at least one amino acid position with a different amino acid, where the different amino acid is the amino acid is the amino acid the amino acid is the amino acid found at the corresponding FR position of a human subgroup
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Producing an antibody or antigen binding fragment in high yield in a cell culture, comprises expressing a variable domain with a modified framework
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                modified framework region; hypervariable region; cytostatic; antiinflammatory; antiangiogenic; immunomodulatory; antibody therapy; tumour; inflammatory; disorder; angiogenic disorder; immunological disorder; anti-VEF antibody; anti vascular endothelial cell growth factor antibody; heavy chain.

(HYR1) and/or HYR2 amino acid sequence with the most sequence identity with a corresponding HYR1 and/or HYR2 sequence of the variable domain.

With a corresponding HYR1 and/or HYR2 sequence of the variable domain.

The antibody or antigen binding fragment variable domain comprises the modified FR that has improved yield in cell culture compared to an unmodified antibody or antigen-binding fragment. The antibody and antigen binding fragment have eytostatic, antiinflammatory, antianglogenic and immunomodulatory activities, and can be used in antibody therapy. The methods and compositions of the present invention are useful for producing antibodies or antigen binding fragments in cell culture, in particular for improving the yield of recombinant antibodies or antigen binding fragments in cell culture. The antibodies of the invention can be used to diagnose, treat, inhibit or prevent e.g. tumours and can be inflammatory, angiogenic and immunological disporders. The present sequence represents the heavy chain of an anti-VEGF (vascular endothalial sequence represents) antibody, which is used in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Producing an antibody or antigen binding fragment in high yield in a cell culture, comprises expressing a variable domain with a modified framework region in a host cell.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention describes a method for producing an antibody or antigen binding fragment in high yield in a cell culture. The method comprises expressing a variable domain of the antibody or antigen binding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       modified framework region; hypervariable region; cytostatic; antiinflammatory; antiangiogenic; immunomodilatory; antibody therapy; tumour; inflammatory; disorder; angiogenic disorder; immunological disorder; anti-vese anti-ves
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

recovering the antibody or antigen binding fragment variable domain comprising the antibody or antigen binding fragment variable domain comprising the modified framework from the host cell. The modified FR in the method described above has a substitution of at least one amino acid position with a different amino acid, where the different amino acid is the amino acid found at the corresponding FR position of a human subgroup the amino acid found at the corresponding FR position of a human subgroup or variable domain consensus sequence that has a hypervariable region. It (HVR1) and/or HVR2 samino acid sequence with the most sequence identity with a corresponding HVR1 and/or HVR2 sequence of the variable domain. Complied FR that has improved yield in cell culture compared to an unaddified antibody or antigen-binding fragment. The antibody and antigen binding fragment. The antibody and antigen binding fragment and compositions of the present invention are useful for methods and compositions of the present invention are useful for producing antibodies or antigen binding fragments in cell culture, in particular for improving the yield of recombinant antibodies or antigen binding fragments in cell culture. The antibodies of the invention can be used to diagnose, treat, inhibit or prevent e.g. tumours and cinflammatory, anglogenic and immunological disorders. The present sequence represents the heavy chain of an anti-VBGF (vascular endothelial sequence represents the heavy chain of an anti-VBGF (vascular endothelial

New humanized, human or chimeric anti-CD74 antibody or fragment, useful for diagnosing or treating a CD74 expressing malignancy, an immune dysregulation disease, an autoimmune disease or graft versus host

Claim 13; Fig 2A; 91pp; English

disease.

```
The invention relates to a humanized, human or chimeric anti-CD74
antibody or its fragment. The naked anti-CD74 antibody or a naked
antibody fusion protein or fragment, or a therapeutic or diagnostic
conjugate comprising an anti-CD74 antibody is useful for diagnosting
conjugate comprising an anti-CD74 antibody is useful for diagnosting or
treating a disorder or a disease that is a CD74 expressing malignancy
c (solid tumour, non-Hodgkin's lymphoma, Hodgkin's lymphoma, multiple
myeloma, another B-cell malignancy and a T-cell malignancy), an immune
c graft versus host disease. The solid tumour is melanoma, carcinoma and
sarcoma. The arcinoma is a renal carcinoma, lung carcinoma and
c arcinoma, stomach carcinoma and melanoma. The B-cell malignancy is of
non-Hodgkin's lymphoma, Hodgkin's lymphomas, indolent forms of B-cell
lymphomas, aggressive forms of B-cell lymphomas, chronic lymphatic
leukemiss, acute lymphatic leukemias, and multiple myeloma. The present
sequence represents a chimeric anti-CD74 antibody LL1 (cLL1) heavy chain
variable region

dysregulation disease, an autoimmune disease, organ graft rejection, and graft versus host disease. The solid tumour is melanoma, carcinoma and sarcoma. The carcinoma is a renal carcinoma, lung carcinoma, intestinal carcinoma, stomach carcinoma and melanoma. The B-cell malignancy is of non-Hodgkin's lymphoma, Hodgkin's lymphoma, indolent forms of B-cell lymphomas, aggressive forms of B-cell lymphomas, chronic lymphatic leukemias, acute lymphatic leukemias, and multiple myeloma. The present sequence represents a murine anti-CD74 antibody LL1 heavy chain variable
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to a humanised, human or chimeric anti-CD74 antibody or its fragment. The naked anti-CD74 antibody or a naked antibody or its fragment. The naked antibody or a naked antibody is useful for diagnostic conjugate comprising an anti-CD74 antibody is useful for diagnostic freating a disorder or a disease that is a CD74 expressing malignancy (solid tumour, non-Hodgkin's lymphoma, Hodgkin's lymphoma, multiple myeloma, another B-cell malignancy and a T-cell malignancy), an immune disease, an autoimmune disease, organ graft rejection, and graft versus host disease. The solid tumour is melanoma, carcinoma and sarcoma. The carcinoma is a renal carcinoma. The B-cell malignancy is of non-Hodgkin's lymphoma, Hodgkin's lymphoma, Hodgkin's lymphoma, Hodgkin's lymphoma, independent is a renal lymphomas, chronic lymphatic leukemias, and multiple myeloma. The present leukemias, acute lymphatic leukemias, and multiple myeloma. The present

polymeric carriers, and effectors.

Disclosure; SEQ ID NO 6; 44pp; English.

The invention describes a composition (I) comprising an immunoconjugate which has one or more anti-CD74 binding molecules conjugated to one or more lapids, polymeric carriers, micelles, nanoparticles or their conbinations, and one or more effectors. Also described are: preparing combinations, and one or more effectors. Also described are: preparing combinations, and one or more effectors. Also described are: preparing combinations, and one or more effectors with an anti-CD744 antibody; and a kit comprising (I). (I) is useful for treating and/or antibody; and a carrier, and contacting the carrier with an anti-CD744 carrier of a graft-versus-host disease. The CD74-expressing malignancy, immune dysregulation disease. The CD74-expressing malignancy is of CD74-expressing malignancy is a Solid tumor. Which is chosen from and graft-versus-host disease. The CD74-expressing malignancy is a solid tumor, which is chosen from melanoma, carcinoma, proceed is CD74-expressing malignancy is a solid tumor, which is chosen from melanoma, prostate cancer, ovarian cancer, and melanoma. The CD74-expressing malignancy is a solid tumor, which is chosen from melanoma, prostate cancer, ovarian cancer, and melanoma. The CD74-expressing malignancy is a solid tumor, which is chosen from comparises LIJ or its fragment. The composition further comprises one or composition further comprises one or more additional antibodies or their fragments chosen from anti-CD19, anti-CD2, anti-CD3, anti-CD3, anti-CD3, anti-CD3, anti-CD2, anti-CD2, anti-CD2, anti-CD3, anti-CD
